

# Installation Note

**Most production models of Coleman's series 5387 flashlights have their upper (+) battery contact recessed behind a plastic flange, and the original batteries will usually have a small metal button welded to the top of each one. When you replace the original batteries, the upper (+) contact of the topmost replacement battery must reach up to the recessed upper contact in the flashlight head. Our new batteries have a folded metal tab welded to the top of each one. It is usually necessary to fold back the tab on the topmost battery only, so that the extended tab will reach up to make a proper connection with the upper metal contact in the flashlight head. Leave the tab folded down the side on all remaining batteries. All of the new batteries must be installed in the same direction, so that their tabbed ends are pointing toward the head of the flashlight. Call 912-999-6378 or email us if you have any problems when installing your new batteries.**
